i Khimicheskaya Tekhnologiya (USSR) 1959, no. 1,
p. 28-31.

Potentiometric measurements during hydrogenation of
fats and of their simplest analogues, unsaturated acid
esters, give a correct indication of the change in fatty
acid composition and of the sequence in the saturation
of acids of different degrees of unsaturation. With hy-
drogenation of fats in solvents, the process is suffi-
ciently selective. The potentiometric method is very
suitable for a study of the reaction selectivity during
hydrogenation of both natural fats and oils and their
synthetic analogues. (Author)
